## Project: Domain-Specific SLM for Legal Advice, in the Tax Domain

*Project Domain: Tax Law*

### Impact Statement

---

#### The Problem We Are Addressing

Nigeria's 2026 tax reforms replaced long-standing legislation with a new legal framework, but public understanding has not kept pace. Individuals, small businesses, and even tax practitioners are left interpreting complex provisions with limited official guidance, while general-purpose AI tools frequently answer from outdated, repealed law. The result is confidently stated but legally incorrect guidance that carries real financial and regulatory risk.

#### Our Intended Impact

Team Kasai is building a domain-specific small language model, fine-tuned exclusively on current Nigerian tax legislation and official guidance, to close this gap. The model is designed to give accurate, source-grounded, and explainable answers to everyday tax questions — covering Company Income Tax, VAT, PAYE, Personal Income Tax, exemptions, filing requirements, and penalties — while clearly distinguishing current law from repealed law.

By anchoring every response in an authoritative, provenance-tracked dataset, the project aims to:

- Reduce the risk of individuals and businesses relying on outdated tax rules and facing avoidable penalties.
- Make the 2026 tax reforms easier to understand for people without access to professional tax advice.
- Give tax practitioners and developers a reliable reference tool that cites its legal sources.
- Promote voluntary tax compliance by lowering the barrier to understanding one's obligations.
- Demonstrate a responsible, transparent approach to building legal-domain AI in a Nigerian context.

#### How We Will Know We Have Succeeded

Success is measured not only by model accuracy on tax questions, but by whether the system correctly separates current from repealed law, discloses the source behind each answer, and behaves safely on questions at the edge of its knowledge — for example, by pointing users toward professional advice rather than guessing. The project explicitly does not aim to replace professional legal or tax advice, but to make reliable first-line information accessible.

#### Guiding Values

The project's design choices — authoritative sourcing, explicit current/repealed labelling, traceable metadata, human validation, and documented limitations — are grounded in accuracy, fairness, transparency, privacy, inclusivity, safety, reliability, and explainability.
