

TEAM KASAI

Project: Domain-Specific SLM for Legal Advice, in the Tax Domain

Project Domain: Tax Law

Stakeholder Card

The table below maps the people and institutions affected by the Nigerian Tax Law SLM, what each group needs from the project, how the project is designed to benefit them, and the concerns Team Kasai must actively manage for each.

Stakeholder	Who they are	What they need	How the project benefits them	Concerns to manage
Individual taxpayers	Employees, informal-sector workers, and everyday citizens navigating the 2026 tax reforms.	Plain-language, trustworthy answers about obligations, filing, and exemptions.	Faster access to accurate guidance; lower risk of penalties from outdated information.	Must not substitute for professional advice; needs to handle informal-sector nuance.
SMEs & small business owners	Small and medium enterprises with limited in-house tax expertise.	Practical compliance guidance on CIT, VAT, PAYE, and filing deadlines.	Reduced compliance costs and improved understanding of current obligations.	Complex, business-specific queries may exceed model scope.
Tax practitioners & advisors	Professionals who research and apply tax law on behalf of clients.	A fast, source-cited reference to check current provisions and repealed status.	Time savings on research; a second reference point with traceable citations.	Requires high legal accuracy and clear source attribution to be trusted professionally.
Developers & researchers	Builders and academics working on legal-domain AI or Nigerian regulatory tech.	A well-documented, provenance-tracked dataset and reproducible pipeline.	A reusable dataset/model and a template for responsible legal-domain SLM development.	Dataset licensing, versioning, and documentation of limitations must be clear.
Nigerian Revenue Service & government institutions	Bodies responsible for administering and publishing tax law and guidance.	Accurate public representation of current legislation and official guidance.	Supports voluntary compliance and public understanding of the 2026 reforms.	Requires strict fidelity to official sources; no unauthorised legal interpretation.
Team Kasai / TRI AI programme	The project team and the wider AI training programme it belongs to.	A working, well-evaluated demonstration of responsible domain-specific SLM design.	A portfolio project evidencing the full pipeline: sourcing, labelling, fine-tuning, evaluation.	Scope and timeline must stay realistic given data-sourcing and validation effort.
